

## Bindable Properties and Events

How do you know to which Properties or Events of HTML Elements you may bind? You can basically bind to all Properties and Events - a good idea is to `console.log()` the element you're interested in to see which properties and events it offers.

**Important:** For events, you don't bind to onclick but only to click (=> (click)).

The MDN (Mozilla Developer Network) offers nice lists of all properties and events of the element you're interested in. Googling for `YOUR_ELEMENT` `properties` or `YOUR_ELEMENT events` should yield nice results.
